Belle II Data Handling Prototype

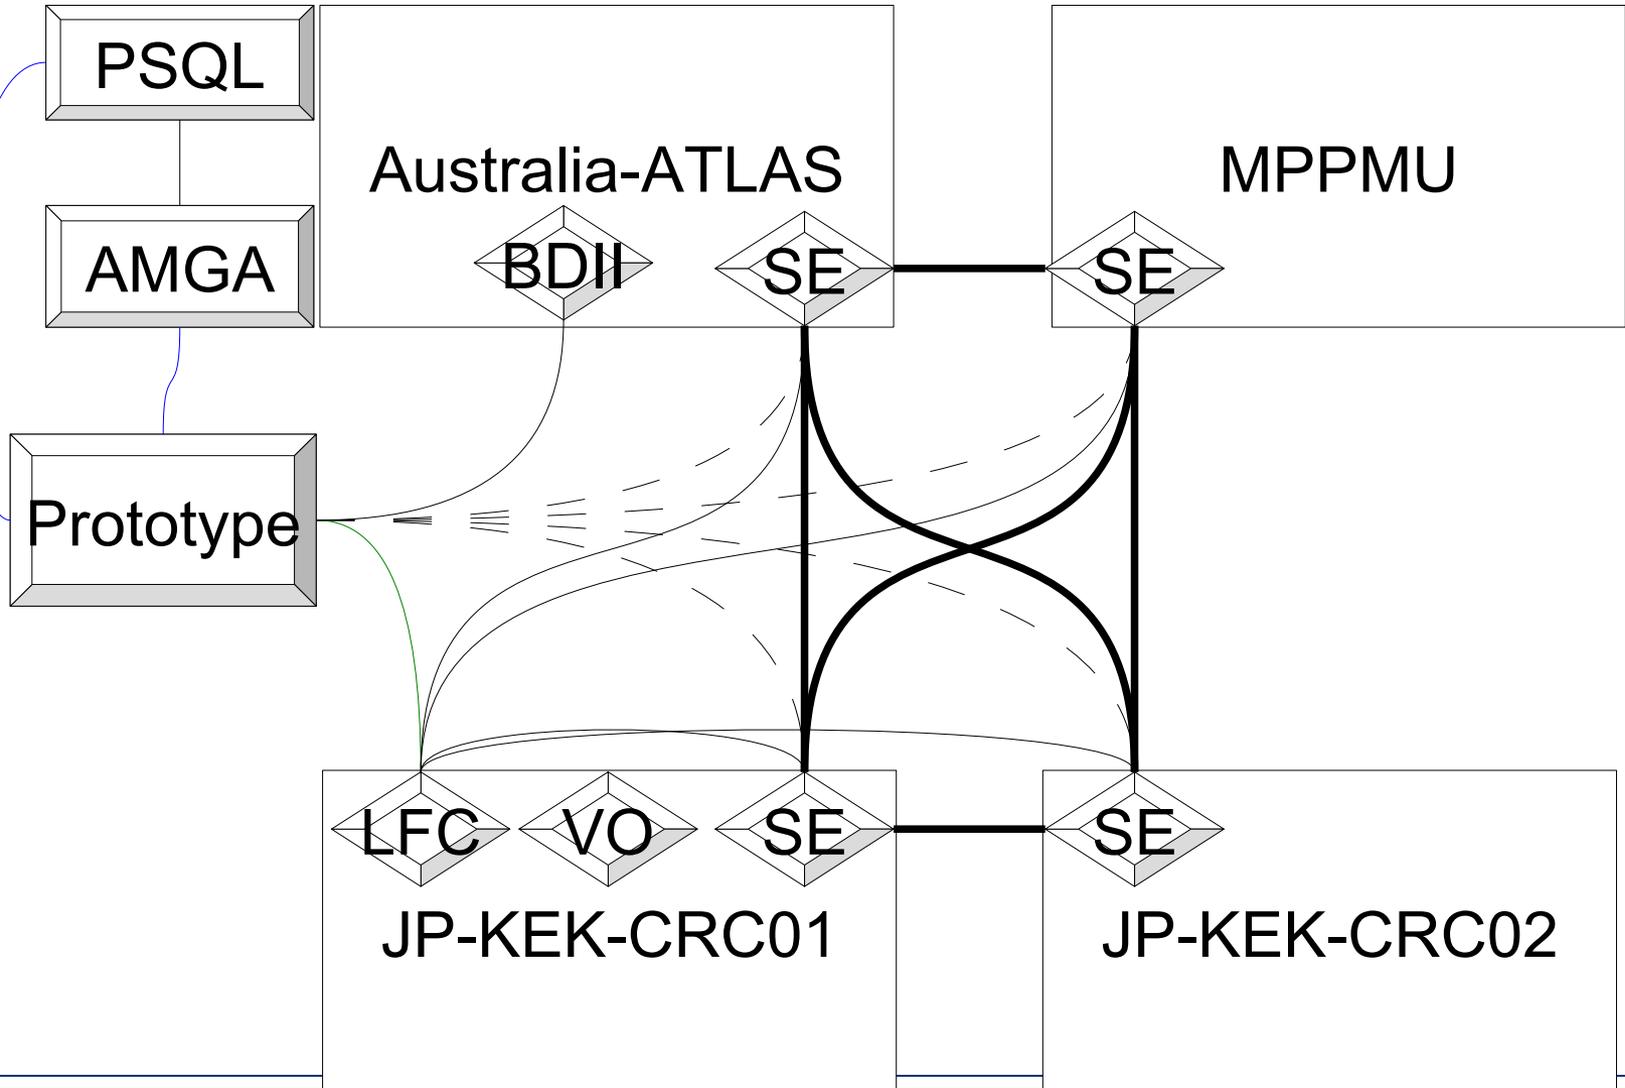

- The goal of the testbed is to test the concepts proposed by Kuhr
- A solution using gLite middleware, with Belle II-specific software based on ideas used at CDF
- A prototype demonstrating this was deemed worth creating (Computing Meeting)

- Testing technical possibilities
 - Determining strengths, weaknesses and potential problems
- Making an application that's reusable for simulation
 - Can be used to add test data for “real” system
- Providing Polish developers with a basis

- “Hacky” Python
 - Single thread, poor performance
- Python bindings for
 - LFC
 - AMGA
 - LCG-UTILS
- Uses existing Belle VO

- Create:
 - prototype -c /local/path/to/dataset [-s SE]
 - Inside local directory are files, filename.meta.data, and meta.data
 - Only like this for testing
 - Copies files to designated SE
 - Updates LFC with information
 - Registers metadata and GUID in AMGA

- Replicate
 - prototype `-r /path/to/dataset -s “['site', 'site', ..., 'site']”`
 - Copies files to each SE in list
 - Uses closest SE to destination SE
 - Updates LFC
 - No AMGA update needed – AMGA tracks GUIDs which do not change
- Delete
 - prototype `-d /amga/path/to/dataset`
 - Deletes the dataset and metadata

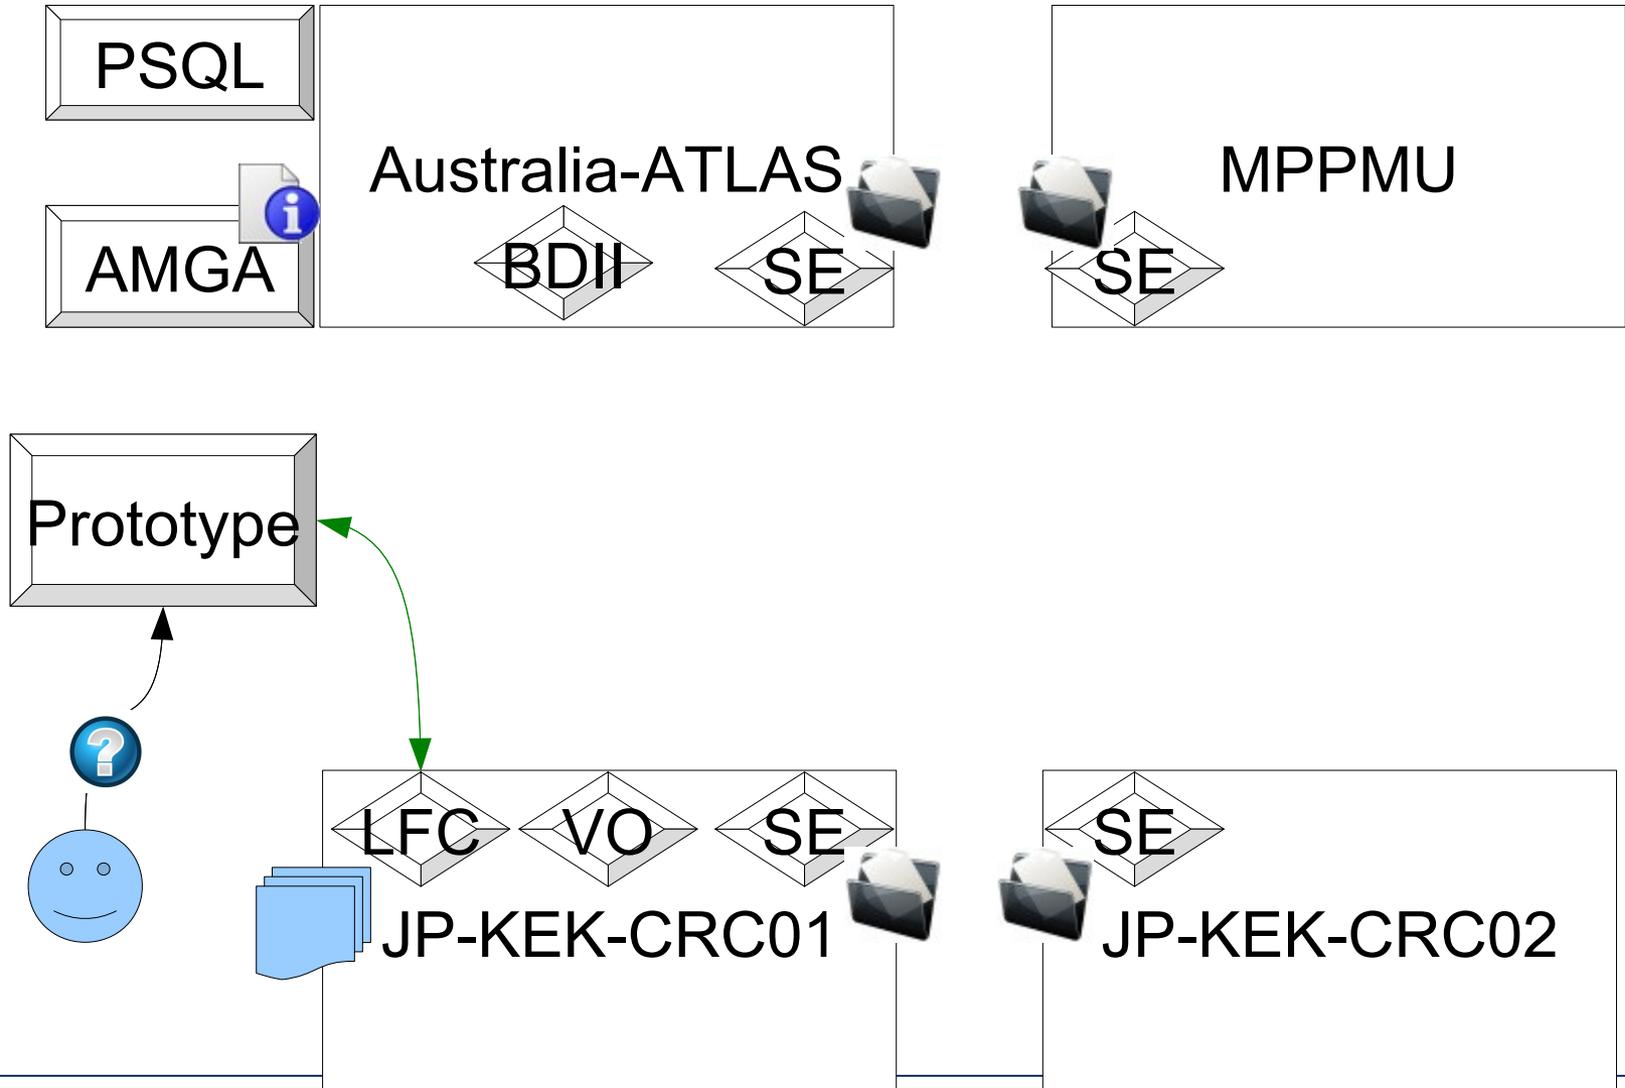

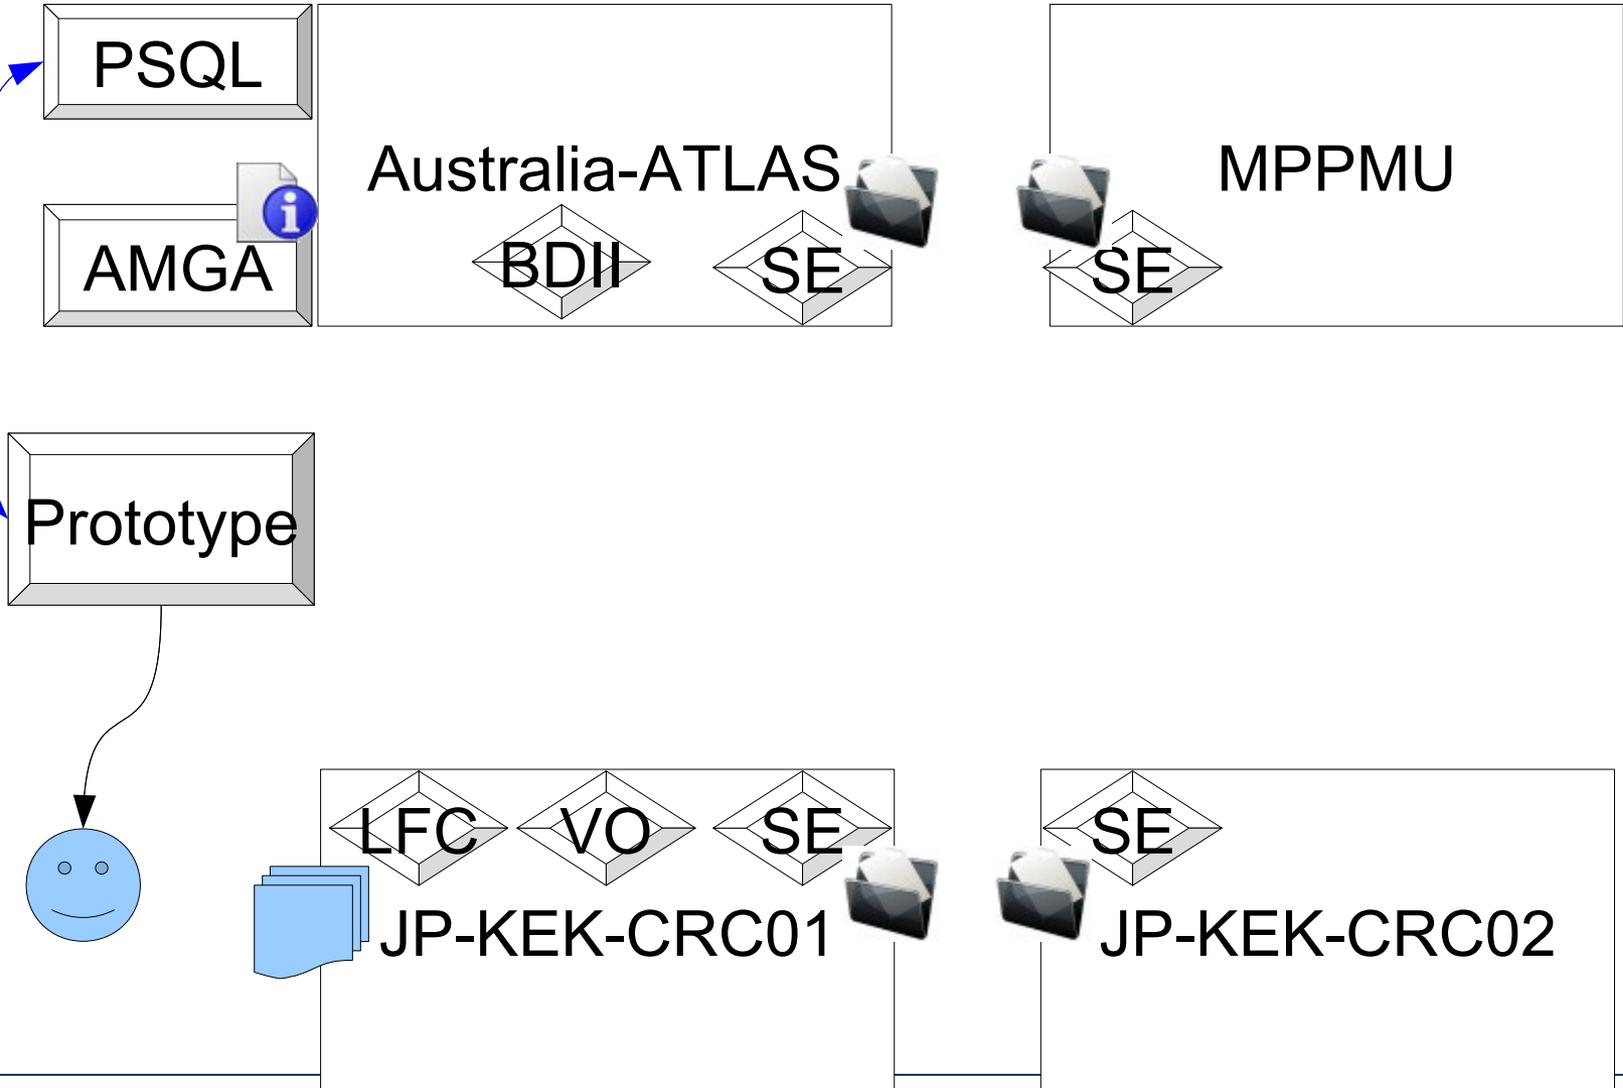

- `prototype -q <data/MC> -e exp_no -t skim_type -s 'attr=val'`
- `prototype -q <data/MC> -e [exp_no, exp_no2, ...] -t ["skim_type",...] -s "attr='val' and attr2='val' and ... and attrN='val'"`
 - Aiming for flexibility
 - Search string (“-s”) is a free list of any metadata element – you can even use boolean logic
 - Can accept multiple experiments, skims

```
[fifieldt@ui ~]$ ./prototype.py -q data -e 61 -t HadronB -s 'user_id="fifieldt"'
```

Doing SSL handshake using builtin SSL

```
Sending > selectattr /belle/data/61/HadronB/file2:guid 'user_id="fifieldt"' <

```
[fifieldt@ui ~]$ ./prototype.py -q data -e '[61, 63]' -t ['"HadronB", "TauPair"]' -s  
  'user_id="fifieldt"'
```

/belle/data/61/TauPair doesn't exist (ignoring)

/belle/data/63/TauPair available at Set(['JP-KEK-CRC-01', 'Australia-ATLAS'])

/belle/data/61/HadronB available at Set(['JP-KEK-CRC-01', 'JP-KEK-CRC-02',
'MPPMU', 'Australia-ATLAS'])

/belle/data/63/HadronB available at Set(['Australia-ATLAS'])

Project ID#80

Can be run at:

Australia-ATLAS

- You can see from the type of queries I run, I'm not a physicist (maybe HH and FullRecon would be better?)
- We need your help to make sure the metadata is useful to you – see the next presentation :)

```
[fifieldt@ui ~]$ ./prototype.py -q data -e '[61, 63]' -t '["HadronB", "TauPair"]' -s  
'user_id="fifieldt" and no_evt<200'
```

/belle/data/61/TauPair doesn't exist (ignoring)

/belle/data/63/TauPair available at Set(['JP-KEK-CRC-01', 'Australia-ATLAS'])

/belle/data/61/HadronB available at Set(['JP-KEK-CRC-01', 'JP-KEK-CRC-02',
'MPPMU', 'Australia-ATLAS'])

/belle/data/63/HadronB available at Set(['Australia-ATLAS'])

Project ID#84

Can be run at:

Australia-ATLAS

- This handles the steps which
 - Get data where it needs to be
 - Allow everyone to find out what data is where
- Still to come
 - Making that data accessible to the framework on computing resources
 - Submit a job to a site using the project ID
 - Cream CE

- AMGA supports replication
 - eg 'Master' at KEK, slaves at regional centers (i.e. “Tier 1s”)
- AMGA can also use oracle backend
- LFC also supports “central” and “local” instances
- All of these storage technologies are proven and in use on the WLCG
- One project server per region
